

Use Sign Channel to fit signs to Palisade fencing with NO visible fixings... Nice!

Normally signage is fitted to palisade fencing types by screwing through the signage and fence to secure. Visible fixings can be avoided and you can look super clever by fitting the signage using the steps below.

1

Prepare panel with channel, cut and drilled flat bar and M8 nuts, bolts and washers

2

Slide the bolt heads into the channel, place the sign against the fence and position the bolt heads

3

Position the flat bar over the bolts on the other side of the fence as shown

4

Place the washer under the nut and tighten to hold the panel in place

5

Repeat the process with the bottom run of channel to secure your sign

RIGHT, OVER TO YOU... **GO SAVE THE DAY.**
